SECTION 5
UNIFIED SYSTEM INTERFACE UNIT

The unified system interface unit (USIU) of the MPC555 controls system start-up, system initialization and operation, system protection, and the external system bus. The MPC555 USIU functions include the following:

- System configuration and protection
- Interrupt controller
- System reset monitoring and generation
- Clock synthesizer
- Power management
- External bus interface (EBI) control
- Memory controller
- Debug support

5.1 Module Overview

The system configuration and protection function controls the overall system configuration and provides various monitors and timers, including the bus monitor, software watchdog timer, periodic interrupt timer, PowerPC decrementer, time base, and real time clock. The interrupt controller and USIU are also included in the system configuration and protection function. Refer to **SECTION 6 SYSTEM CONFIGURATION AND PROTECTION** for details.

The reset controller receives input from a number of reset sources and takes appropriate actions, depending on the source. The reset status register (RSR) reflects the most recent source to cause a reset. Refer to **SECTION 7 RESET** for details.

The clock synthesizer generates the clock signals used by the SIU as well as the other modules and external devices. This circuitry can generate the system clock from a 4-MHz or 20-MHz crystal.

The SIU supports various low-power modes. Each supplies a different range of power consumption, functionality and wake-up time. The clock scheme supports low-power modes for applications that use the baud rate generators and/or serial ports during the standby mode. The main system clock can be changed dynamically while the baud rate generators and serial ports work with a fixed frequency. Clock generation and low-power modes are described in **SECTION 8 CLOCKS AND POWER CONTROL**.

The external bus interface (EBI) handles the transfer of information between the internal busses and the memory or peripherals in the external address space. The MPC555 is designed to allow external bus masters to request and obtain mastership of the system bus, and if required access the on-chip memory and registers. **SECTION 9 EXTERNAL BUS INTERFACE** describes the bus operation.

The memory controller module provides a glueless interface to many types of memory devices and peripherals. It supports up to four memory banks, each with its own device and timing attributes. See **SECTION 10 MEMORY CONTROLLER** for more information.

5.2 SIU Architecture

**Figure 5-1** is a block diagram of the MPC555 USIU.

5.3 USIU Address Map

Table 5-1 is an address map of the SIU registers. Where not otherwise noted, registers are 32 bits wide. The address shown for each register is relative to the base address of the MPC555 internal memory map. The internal memory block can reside in one of eight possible 4-Mbyte memory spaces. See **Figure 1-3** in **SECTION 1 OVERVIEW** for details.

5.4 USIU PowerPC Memory Map

Table 5-2 lists the USIU PowerPC special-purpose registers (SPR). These registers can be accessed with the PowerPC **mtspr** and **mfspr** instructions, or from an external master (refer to **6.2 External Master Modes** for details). All registers are 32 bits wide.

Table 5-2 USIU Special-Purpose Registers

Internal Address[0:31]	Register	Decimal Address spr[5:9]:spr[0:4][1]
0x2C00	Decrementer (DEC)	22
0x1880	Time Base — Read (TB)	268
0x1A80	Time Base Upper — Read (TBU)	269
0x3880	Time Base — Write (TB)	284
0x3A80	Time Base Upper — Write (TBU)	285
0x3B30	Internal Memory Mapping Register (IMMR)	638

NOTES:
1. Bits [0:17] and [28:31] are all 0.

Table 5-3 shows the PowerPC special address range. For an external master accessing a PowerPC SPR, address bits [0:17] and [28:31] are compared to zeros to confirm that an SPR access is valid.
